

Context ≠ understanding.

More tokens in the window isn't more of it understood.

VANILLA AGENTIC SAAS

- Coerces nuanced deals into non-matching ontologies.
- Forces too much into model context, with increasingly lossy results.
- **Basically: square peg, round hole.**

TRIBE

- Ontology starts from Kirkland's own deal structure, not a generic template.
- Addressable facts encoded from day one.
- **Native learning loop.**

Finds the number no document states

FINANCING EBITDA — CLEARWATER ANALYTICS CREDIT AGREEMENT

Flagship demo example: Clearwater's answer is "Not found" on a naive read, but four quarterly EBITDA figures hard-coded in the EBITDA definition's tail sum to exactly \$213.5M, matching the deal's fixed incremental prong — provable only by cross-referencing and doing arithmetic.

VANILLA AGENTIC SAAS

TERM	Financing EBITDA
ANSWER	Not found
CONFIDENCE	High

HOW IT GOT THERE

No basis given — this is the whole answer.

TRIBE

TERM	Financing EBITDA
ANSWER	\$213.5M
CONFIRMS	fixed incremental prong

HOW TRIBE GOT THERE

Summed four quarterly figures buried in the EBITDA definition's own tail — the number nobody stated directly.

Same underlying text. The number was never stated as a single figure — only assembled once each term became an addressable, linked fact instead of a run of prose.

Keeps looking past the first hit

INCREMENTAL MFN — KINDERCARE, AMENDMENT NO. 3

MFN Protection: 50bps cap, 12mo sunset — tracked as a standing row. Flagship demo example: KinderCare has a second, identical MFN hidden inside the Permitted Ratio Debt definition, with its own sunset running from the Closing Date — invisible unless you search past the first hit.

VANILLA AGENTIC SAAS

TERM	Incremental MFN
ANSWER	50bps cap, 12mo sunset
CONFIDENCE	High

HOW IT GOT THERE

No indication a second instance exists.

TRIBE

TERM	Incremental MFN
INSTANCE 1	50bps cap, 12mo sunset
INSTANCE 2	Permitted Ratio Debt sunset from Closing Date

WHAT THIS MEANS

A second MFN, same structure, sitting one definition away from the first — missed by any search that stops at the first hit.

The first MFN is correct and confidently reported either way. The second one is the one that matters — and only a system that models “this term can recur” keeps looking for it.

Turns silence into a concrete ask

SIX TERMS, UNDEFINED ACROSS ALL 15 SAMPLE CREDIT AGREEMENTS

These 6 terms produced 90 of 104 ungradeable rows in the 690-extraction spike — every one of the 15 sample credit agreements failed to yield a gradeable answer, purely for lack of a K&E-supplied definition or pass/fail standard.

VANILLA AGENTIC SAAS

XEROX BLOCKER	Not found
J. CREW BLOCKER	Not found
AUTO CURE	Not found

THE OTHER THREE

At Home Blocker, Anti-Coop Provisions, Collateral/Pledge Voting Limits — same “Not found,” same confidence. No signal any of the six are different from a normal miss.

TRIBE

- Xerox Blocker undefined
- J. Crew Blocker undefined
- At Home Blocker undefined
- Anti-Coop Provisions undefined
- Auto Cure undefined
- Collateral / Pledge Voting Limits undefined

HOW IT GOT THERE

Flagged as a defined gap, not a failed search — each one routed back to K&E as a named item to define.

A bigger context window changes nothing here. The gap isn’t retrieval depth — it turns a vague “we need more from Kirkland” into a concrete, six-item ask.
